                                                                                                                                                          sequencing consortium are that all bases are either sequenced unambiguously on both strands, or on a single strand with both a dye primer and dye terminator reaction, from distinct subclones. Exceptions are indicated by an explicit note.

IMPORTANT: This sequence is NOT necessarily the entire insert of the specified clone. It may be shorter because we only sequence overlapping sections once, or longer because we arrange for a small overlap between neighbouring submissions.

This sequence is the entire insert of clone F53F1. The true right end of clone M04G12 is at 21759 in this sequence. The start of this sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Submitted (21-007-1996) Louis, MO 63110, USA. E-mail: jes@sanger.ac.uk or rw@nematode.wust1.edu Coding sequences below are predicted from computer analysis, using predictions from Genefinder (P. Green, U. Washington), and other available information.

```
bin/display?db=wormacesclass=Sequence &object=F53B6 Current sequence finishing criteria for the C. elegans genome sequencing consortium are that all bases are either sequenced unambiguously on both strands, or on a single strand with both a dye primer and dye terminator reaction, from distinct subclones.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    sequence Z81523.

The true left end of clone F32H2 is at 32306 in this sequence. The true right end of clone T08G11 is at 7984 in this sequence. The true right end of clone T08G11 is at 7984 in this sequence. The start of this sequence (1. .105) overlaps with the end of sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      overlap between neighbouring submissions.

IMPORTANT: This sequence is not the entire insert of clone F53B6.

It may be shorter because we only sequence overlapping sections once, or longer because we arrange for a small overlap between
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Exceptions are indicated by an explicit note.

IMPORTANT: This sequence is NOT necessarily the entire insert of the specified clone. It may be shorter because we only sequence overlapping sections once, or longer because we arrange for a small content of the second section.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Submitted (21-OCT-1996) Louis, MO 63110, USA. On Oct 19, 1999 this sequence version replaced gi:6016917.
Order of segments is not known: 800 n's separate segments.
IMPORTANT: This sequence is unfinished and does not necessarily
represent the correct sequence. Work on the sequence is in progress
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Caenorhabditis elegans.
Caenorhabditis elegans.

The true left end of clone F08A8 is at 152766 in this sequence. The true right end of clone B0019 is at 105 in this sequence. The stoff this sequence (1. .105) overlaps with the end of sequence
                                                                                                                                                                                                                                                                         IMPORTANT: This sequence is NOT necessarily the entire insert of the specified clone. It may be shorter because we only sequence overlapping sections once, or longer because we arrange for a small overlap between neighbouring submissions.

IMPORTANT: This sequence is not the entire insert of clone Y18D10A

E-mail: jes@sanger.ac.uk or rw@nematode.wustl.edu On Nov 21, 1998 this sequence version replaced gi:3873430. On Nov 21, 1998 this sequence version replaced gi:3873430. On Nov 21, 1998 this sequence is unfinished and does not necessarily represent the correct sequence. Work on the sequence is in progress and the release of this data is based on the understanding that the sequence may change as work continues. The sequence may be contaminated with foreign sequence from E.coli, yeast, vector, phage etc. Order of segments is not known; 800 n's separate

Exceptions are indicated by an explicit note.

IMPORTANT: This sequence is NOT necessarily the entire insert of the specified clone. It may be shorter because we only sequence overlapping sections once, or longer because we arrange for a small overlap between neighbouring submissions.

IMPORTANT: This sequence is not the entire insert of clone Y111B2D. It may be shorter because we only sequence overlapping sections once, or longer because we arrange for a small overlap between
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Coding sequences below are predicted from computer analysis, using predictions from Genefinder (P. Green, U. Washington), and other

                                                                                                                                                                                                                                                                                                                                                           prodn. and diagnosis

PS Claim 20; Fig lA-E; 69pp; French.

CC This sequence corresponds to the genomic sequence encoding a Plasmodium

CC falciparum strain K1 pre-erythrocytic liver stage antigen-3 (LSA-3)

CC protein (W24790). The gene sequence was isolated by screening a

CC protein was strain T9-96 library with the serum from a missionary

CC treated by prophylaxis (for strain T6/96 see FR9101286). Of 20 clones

CC isolated, clone 7295 was used to screen a library generated from Thai

CC strain K1. One clone contained a 6.85 kb insert including the sequence

CC presented here. The gene organisation comprises a first exon, a short

C1 8b bp intron and a 5 kb second exon containing a 1.8 kb region encoding

CC 10 locks of 4 amino acid repeats and a 3' hydrophobic region

CC corresponding to a glycosyl-phosphatidylinositol membrane anchoring

CC sequence. The invention relates to new polypeptides of at least 10

CC amino acids derived from the LSA-3 polypeptide with the exception of

CC peptides W24791-4. The LSA-3 peptides can be used to raise antibodies

CC according to a glycosyl-phosphatidylinositor raise antibodies

CC sequence. The invention relates to new polypeptides of at least 10

CC amino acids derived from the LSA-3 polypeptide with the exception of

CC peptides W24791-4. The LSA-3 peptides can be used to raise antibodies

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Дď
       This sequence represents the var-7 gene of plasmodium. Var-7 belongs to the Duffy binding like (DBL) family of genes which have homology to the Duffy antigen binding protein (DABP) and siallic acid binding protein (SABP) conserved regions (see T7288) and T72888 respectively). The var family of genes modulate cytoadherence and antigenic variation of plasmodium infected erythrocytes. SABP and the Duffy antigen binding protein (DABP) are soluble proteins that appear in the culture supernatant after infected erythrocytes release merozoites. DABP and SABP mediate the binding of merozoites and schizonts to the erythrocyte surface. These proteins are necessary for erythrocyte invasion by the parasite. This sequence can be used in the compositions of the invention.

p. falciparum liver stage antigen-3 genomic sequence.

P. falciparum pre-erythrocyte; liver stage antigen; serum;

plasmodium falciparum; pre-erythrocyte; liver stage antigen; serum;

prophylaxis; Thai strain; gene organisation; exon; intron; hydrophob

glycosyl-phosphatidylinositol membrane anchoring sequence; antibody;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      var-1, var-2, var-3 or var-7 genes of the DBL gene family, a family genes having homology with conserved regions of DABP and SABP. The compositions are used for the treatment and prevention of malaria. I are also used in the preparation of vaccines for inducing a protecti immune response in a mammal to plasmodium merozoites (especially plasmodium falciparum or Plasmodium vivax).

CC Inlim 20; Fig 1A-E; 69pp; French.

CC This sequence corresponds to the genomic sequence encoding a Plasmodium CC falciparum strain K1 pre-erythrocytic liver stage antigen-3 (LSA-3)

CC protein (W24790). The gene sequence was isolated by screening a CC protein (W24790). The gene sequence was isolated by screening a CC protein (W24790). The gene sequence was isolated by screening a CC isolated by prophylaxis (for strain T6/96 see FR9101286). Of 20 clones CC isolated, clone 729S was used to screen a library generated from Thai CC strain K1. One clone contained a 6.85 kb insert including the sequence CC presented here. The gene organisation comprises a first exon, a short CC 168 bp intron and a 5 kb second exon containing a 1.8 kb region encoding CC plocks of 4 amino acid repeats and a 3 hydrophobic region corresponding to a glycosyl-phosphatidylinositol membrane anchoring Sequence. The invention relates to new polypeptides of at least 10 cm and as derived from the LSA-3 polypeptide with the exception of peptides W24791-4. The LSA-3 polypeptide with the exception of Sequence 6152 BP; 2725 A; 463 C; 1215 G; 1749 T;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Qγ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Probabilitating extra-chromosomal replication of Polypeptide facilitating extra-chromosomal replication of Precombinant plasmid in Dictyostelium species

Claim 15; Fig 1; 90pp; English.

Claim 15; Fig 1; 90pp; English.

Creading frame indicated in the Features Table. The possible ORF is creading frame indicated in the Features Table. The possible ORF is creading frame indicated in the Features Table. The possible ORF is creading frame indicated in the Features Table. The possible ORF is creading frame indicated in the Features The RNA and polypeptide product of the Rep gene have not, however, been detected. It is creative that the product is produced in low amounts to positively cregulate initiation of plasmid replication. The polypeptide may also contain regions that act as negative regulators of plasmid copy contain regions that act as negative regulators of plasmid copy contain regions that act as negative regulators of plasmid copy contain regions that act as negative regulators of plasmid copy contain regions that act as negative regulators of plasmid copy contain regions that act as negative regulators of plasmid copy contain regions that act as negative regulators of plasmid copy contain regions that act as negative regulators of plasmid copy contain regions that act as negative regulators of plasmid copy contain regions that act as negative regulators of plasmid copy contain regions that act as negative regulators of plasmid copy contain regions that act as negative regulators of plasmid copy contain regions that act as negative regulators of plasmid copy contain regions that act as negative regulators of plasmid copy contain regions that act as negative regulators of plasmid copy contain regions that act as negative regulators of plasmid copy contain regions that act as negative regulators of plasmid copy contain regions that act as negative regulators of plasmid copy contain regions 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

The cDNA encodes a protein that includes 2 insert sequences not found in other CPSII proteins. The first separates the putative structural subdomain and the glutaminese subdomain of the glutamine-amidotransferase subunit of CPSII, while the second separates 2 ATP binding subdomains of the CPSII subunit, CPSa and CPSb.

The encoded peptide (see P90417) is useful in a protective vaccine, esp. against malaria. Produced antibodies are useful for passive immunisation, and antibodies, the protein and the DNA sequence are useful as diagnostic reagents. See also N90211-25 and P90403-19.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Claim 7; Page 59-60; 849p; Engilsh.

Human apolipoprotein B (apoB) scaffold attachment region (SAR) element clones Rh32 (T31530) and Rh10 (T31531) respectively carry the 3' human apoB SAR element and the distal 1212 bp 5' human apoB SAR element and the distal 1212 bp 5' human apoB SAR elements of the human apoB gene chromatin domain. A novel recombinant DNA molecule adapted for transfection of a host cell comprises an erythropoletin (EPO) cDNA (T31529) or genomic clone (T31532) operably linked to an expression control sequence and to the 5' and 3' SAR elements. The SAR elements increase expression of the recombinant EPO in stable, long-term mammalian cell cultures.

comprise either a nucleotide sequence or encoded polypeptide of the var-1, var-2, var-3 or var-7 genes of the DBL gene family, a family of genes having homology with conserved regions of DABP and SABP The compositions are used for the treatment and prevention of malaria. They are also used in the preparation of vaccines for inducing a protective immune response in a mammal to Plasmodium merozoites (especially Plasmodium falciparum or Plasmodium vivax).

Claim 4; Page 56-61; 96pp; English.

This sequence represents the var-7 gene of Plasmodium. Var-7 belongs to the Duffy binding like (DBL) family of genes which have homology to the Duffy antigen binding protein (DABP) and sialic acid binding protein (SABP) conserved regions (see T72889 and T72888 respectively). The var family of genes modulate cytoadherence and antigenic variation of Plasmodium infected erythrocytes. SABP and the Duffy antigen binding
                                                                                                                                                   protein (DABP) are soluble proteins that appear in the culture supernatant after infected erythrocytes release merozoites. DABP and SABF mediate the binding of merozoites and schizonts to the erythrocyte surface. These proteins are necessary for erythrocyte invasion by the parasite. This sequence can be used in the compositions of the invention. The compositions are for the treatment and prevention of malaria, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Plasmodium var-7 gene.

The inventors claim a novel DNA molecule which comprises a nucleotide sequence corresp, to all or a portion of the base sequence coding RESA (N60472) or FIRA (N60473). RESA and FIRA lantigenicity suitable for providing protective immunity against plasmodium falciparum malarial infections.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The inventors claim a novel DNA molecule which comprises a nucleotide sequence corresp. to all or a portion of the base sequence coding RESA (M60472) or FIRA (M60473). RESA and FIRA have antigenicity suitable for providing protective immunity against plasmodium falciparum malarial infections.

Detection or measurement of human breast tumour specific polypeptides and nucleotide sequences, or the corresponding RNA in a sample, is used for diagnosis and monitoring of breast cancer. Human breast tumour specific polypeptides and nucleotide sequences, and the vectors containing the DNAs, are a useful in vaccines for inhibiting development (for prevention or therapy) of breast cancer. The polypeptides may also be used to raise monoclonal antibodies, used as immunoassay reagents. Sequence 715 BP; 183 A; 131 C; 86 G; 294 T;

Disclosure; p; English.

Sequence allows for production of antigenic malarial proteins, useful diagnosis, prevention and treatment of the disease. The sequence may bused in an expression vector, and signal and regulatory sequences may used to stimulate production of other products.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         DB
